

Please understand the dimensions of your spa by use of a tape measure. You will need to consider the Spa will be delivered on its side on a Spa Dolly.

Use the height of the Spa Dolly plus the height of the Spa when stood on its side to determine the vertical clearance required. Use the height of the Spa (when laid flat) which will become the width to determine the maximum width of clearance necessary. If the Spa Dolly width is greater this will be the measurement you will use.

Don't forget to check!

- Check all gates
- Protruding electric metres
- Gas metres
- Vents and flu's

Plenty of sufficient overhead clearance?

- Check low roof eaves,
- overhanging branches,
- Rain gutters

Also is the path clear?

- Remove any other obstacles on the path
- Is there a 90° turn, can we clear it? (The Spa won't bend)

If you are unsure please feel free to contact us!!???
